

Innovations

- **Improved HTML formatting and overall design:** I enhanced the formatting across the app to give it a more modern look. I chose not to use CSS due to time constraints, so all styling was done directly through HTML or Ionic's native components.
 - **Home:** The layout was updated to use small thumbnails with the description displayed underneath. The description is clickable and navigates to the details page.
 - **Movie Details:** The page was restructured using a horizontal scroll layout, with trailers and videos added at the bottom.
 - **Details:** The information section was placed at the top, followed by a horizontal scroll for additional content.
 - **Navigation:** Navigation icons were added across all pages to improve the overall user experience.
- **API videos for trailers:** On the movie-details page, trailers and available videos from TMDB were integrated using the same structure as the other API calls.
- **Navigation service:** I moved all navigation logic into a dedicated service to avoid duplicating code. While it didn't significantly reduce the total amount of code, it centralizes navigation logic, making it easier for others to locate and maintain.
